

Test for Concyclic points: Converse, angles in the same segment

Created by Mr. Francis Hung on 20210915

Last updated: 2024-05-20

In the figure,
if $\alpha = \beta$, then
 A, B, C, D are concyclic.
Abbreviation:
Converse,
 \angle s in the same segment

Proof: Assume that any 3 points are not collinear. Draw a circle which passes through A, B and C . There are 3 different cases:

Case 1 D lies outside the circle

AD cuts the circle at E .

Join BE .

$\angle AEB = \alpha$ (\angle s in the same segment ACB)

$\therefore \alpha = \beta$ (given)

$\therefore BE \parallel BD$ (corr. \angle s eq.)

This is impossible because there are two different parallel lines which meet at B .

\therefore Case 1 is impossible.

Case 2 D lies inside the circle

Produce AD which cuts the circle at E .

Join BE .

$\angle AEB = \alpha$ (\angle s in the same segment ACB)

$\therefore \alpha = \beta$ (given)

$\therefore BE \parallel BD$ (corr. \angle s eq.)

This is impossible because there are two different parallel lines which meet at B .

\therefore Case 2 is impossible.

Case 3 D lies on the circle ABC .

\therefore Case 1 and case 2 are impossible

\therefore The only possible case is case 3.

i.e. D must lie on the circle

This is known as indirect proof.

(反證法)

$\therefore A, B, C, D$ are concyclic.

Test for Concyclic points: Opposite angles supplementary

In the figure,
if $\alpha + \beta = 180^\circ$, then
 A, B, C, D are concyclic.
Abbreviation: **opp. \angle s supp.**

Proof: Assume that any 3 points are not collinear. Draw a circle which passes through A, B and C . There are 3 different cases:

Case 1 D lies outside the circle

\therefore Case 1 is impossible.

Case 2 D lies inside the circle

\therefore Case 2 is impossible.

Case 3 D lies on the circle ABC .

$\therefore A, B, C, D$ are concyclic.

Test for Concyclic points: Exterior angle = interior opposite angle

In the figure, if $x = y$, then A, B, C, D are concyclic

Proof: $\angle ABC = 180^\circ - y$ (adj. \angle s on st. line)

$$\begin{aligned}\angle ABC + \angle ADC &= x + 180^\circ - y \\ &= 180^\circ\end{aligned}$$

$\therefore A, B, C, D$ are concyclic (opp. \angle s supp.)

The theorem is proved.

Abbreviation: **ext. \angle = int. opp. \angle**

Example 1

In the figure, Given $\triangle ABC$, $AB = AC$, $\angle BAC = 36^\circ$, the line bisecting $\angle ABC$ meets the line through C parallel to BA at D . To prove: A, B, C, D are concyclic.

Proof: $\angle ABC = \angle ACB$ (base \angle s isos. \triangle)

$$= \frac{180^\circ - 36^\circ}{2} = 72^\circ \quad (\angle \text{ sum of } \triangle)$$

$$b = b_1 = \frac{72^\circ}{2} = 36^\circ \quad (\angle \text{ bisector})$$

$$d = b = 36^\circ \quad (\text{alt. } \angle\text{s, } AB \parallel DC)$$

$$\therefore \angle A = \angle D$$

$\therefore A, B, C, D$ are concyclic (converse, \angle s in the same segment)

Example 2

In the figure, 2 circles $APRB, ASQB$ intersect at A and B . PAQ, RAS are straight lines, RP and QS are produced to meet at O . To prove: O, P, B, Q are concyclic.

Proof: $p = a$ (\angle s in the same segment)

$$a = q \quad (\angle \text{ sum of } \triangle)$$

$$\therefore p = q$$

$\therefore O, P, B, Q$ are concyclic. (ext. \angle = int. opp. \angle)

Example 3

In the figure, O is the centre of the circle. AOB is a diameter. AC intersects DE at F . If $\angle ADE = \angle DCA = x$, prove that $FEBC$ is a cyclic quadrilateral.

$$\angle ACB = 90^\circ \quad (\angle \text{ in semi-circle})$$

$$\angle DAE = 180^\circ - \angle BCD \quad (\text{opp. } \angle \text{ cyclic quad.})$$

$$= 180^\circ - (90^\circ + x) = 90^\circ - x$$

$$\angle AED = 180^\circ - (90^\circ - x) - x = 90^\circ \quad (\angle \text{ sum of } \triangle)$$

$$\therefore \angle ACB = 90^\circ = \angle AED$$

B, C, F, E are concyclic (ext. \angle = int. opp. \angle)

Orthocentre

Example 4

The **three altitudes** of a **triangle** are **concurrent** at a point called the “**orthocentre**”. (Figure 1)

In $\triangle ABC$, $AD \perp BC$, $BE \perp AC$, $CF \perp AB$.

Then AD , BE , CF are **concurrent** at H .

Figure 1

Proof: Let the **altitudes** BE and CF meet at H .

Join AH and produce it to meet BC at D .

Try **to show** that $AD \perp BC$. (Figure 2)

$$\angle AFH + \angle AEH = 180^\circ$$

A, F, H, E are concyclic. (opp. \angle supp.)

$$\angle BFC = \angle BEC$$

B, C, E, F are concyclic. (converse, \angle s in the same seg.)

Figure 2

In **Figure 3**, let $\angle BAD = x$, $\angle AHF = y$.

$$\angle FEH = x \quad (\angle \text{s in the same seg.})$$

$$\angle BCF = \angle BEF \quad (\angle \text{s in the same seg.})$$

$$= x$$

$$\angle CHD = y \quad (\text{vert. opp. } \angle \text{s.})$$

$$\text{In } \triangle AFH, x + y = 90^\circ \quad (\angle \text{ sum of } \triangle)$$

$$\text{In } \triangle CDH, x + y + \angle CDH = 180^\circ \quad (\angle \text{ sum of } \triangle)$$

$$\therefore \angle CDH = 90^\circ$$

The **theorem is proved**.
