Let x, y and z be three 3-digit numbers such that $x : y : z = 1 : 2 : 3$. If 1, 2, ..., 7, 8, 9 appear exactly once on all digits of x, y and z , find all possible numbers.

Let $x = 100a + 10b + c, y = 100d + 10e + f, z = 100g + 10h + i$.

Note that c, f, i cannot be 5, otherwise, the digits 5 are repeated.

$\therefore z = 3x \leq 999 \Rightarrow 101 \leq x \leq 333 \Rightarrow a = 1, 2 \text{ or } 3$

We shall divide x into 7 intervals and find the possible solution from each interval:

- | | | |
|---------------------------|--|---------------------------|
| (1) $101 \leq x \leq 133$ | | (1) $124 \leq x \leq 132$ |
| (2) $134 \leq x \leq 166$ | | (2) $134 \leq x \leq 164$ |
| (3) $167 \leq x \leq 199$ | But all digits must be different and cannot be 0, $\Rightarrow c, f, i$ cannot be 5. | (3) $167 \leq x \leq 198$ |
| (4) $200 \leq x \leq 233$ | | (4) $213 \leq x \leq 231$ |
| (5) $234 \leq x \leq 266$ | | (5) $234 \leq x \leq 264$ |
| (6) $267 \leq x \leq 299$ | | (6) $267 \leq x \leq 298$ |
